## POETAF

POETAF is a chartstring that will be used instead of General Ledger strings to code project costing transactions within Oracle Financials Cloud and other boundary systems so that PGM expenditures can be tracked.

## POETAF stands for <u>Project</u>, expenditure <u>Organization</u>, <u>Expenditure type</u>, <u>Task</u>, <u>Award</u>, and <u>Fund source</u>.

The following graphic outlines how some POETAF segments correspond to the GL Common Chart of Accounts (CCOA) segments:

General Ledger Common Chart of Accounts (CCOA) Segments / GL String

## Key Benefits

- Automation of encumbrances on the project budget
- Fewer chartstring segments to enter for project costing

## **Key Changes**

- All expenditures related to a PGM project must be charged to the correct POETAF string
- Some POETAF segments correspond to a CCOA segment, which drives the subledger accounting. Subledger transactions roll up to the GL in summary format.
- Additional project information may be used to populate other CCOA segments, including purpose or program
